

Weekly report (2012.11.19~11.25)

Done

- 1) Find out the problem in the MPI communication in the Meteorology Project, it works now.
- 2) This week, I tried taking normal information into consideration when segmenting a model, that means normal and distance both take some weights. In this way, it tends to detect faces rather than parts. By the way, it increases parameters needed to configure and it's hard to get a best configuration.

To Do

- 1) More experiments by change the parameters, maybe there exists some automatic way to optimize the configuration.
